Subject: In class exercise

Currently, only the Safari browser supports Applets. However, we can easily test out Java class that extends JApplet in Eclipse by Run AS Java Applet. Need to show me your working applet being called by Eclipse at start of next class.

Create the JApplet GUI shown below in a class called **CalculatorApplet** using a package of **edu.elon.template.applet**. You have to completely add all of the functionality.

Goal is to multiply 12.1 times 2.

To enter the number 12.1, I hit the buttons 1 then 2 then **.** then 1 or I could type it directly into text field.

I should then be able to click on the times operator (*) followed by 2 followed by = to get
